

# CSC Summer Field Tour- June 6, 2018

## Biogeoclimatic Ecosystem Classification – the foundation for successful species selection

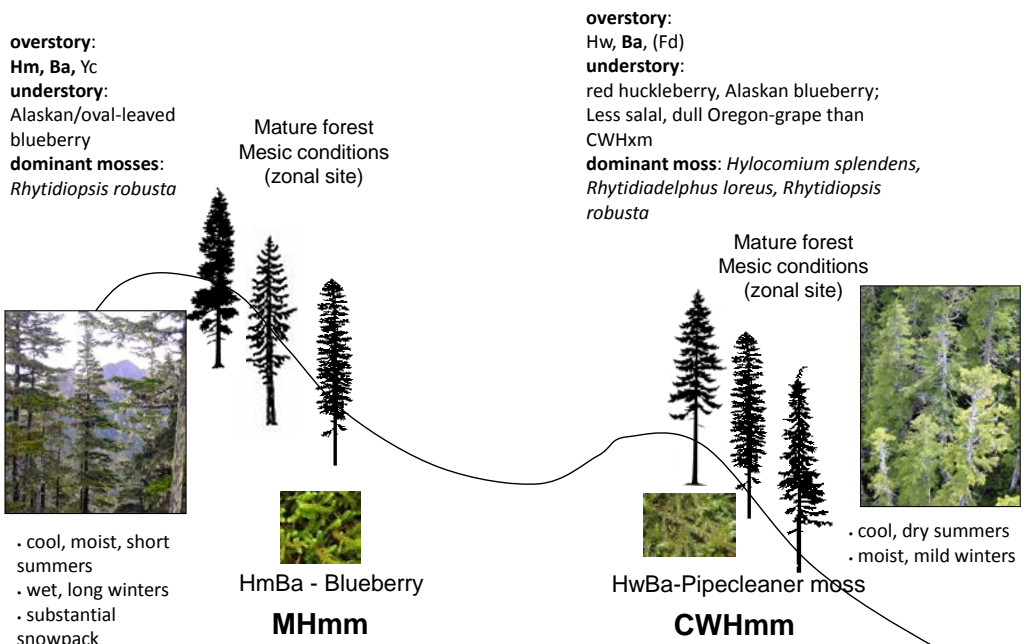

Sari Saunders and Heather Klassen, Research Ecologists, Coast Area, MFLNRORD

### BEC - Integration of 3 Classifications

- Links climate, site and vegetation in an integrated classification across scales
- Framework for ecological understanding, planning and management
- Plant Association – on a zonal site is a diagnostic of a climatic subzone
- Occurrences of a plant association across climatic units define a site association

### BGC Subzones - Definition and Delineation with Zonal Plant Associations

- Focus on the vegetation on zonal sites to determine and delineate your BGC subzone
- Zonal sites
  - vegetation driven by climate rather than site conditions
  - average moisture and nutrient conditions

# Site Series

		Soil Nutrient Regime					
		Very Poor A	Poor B	Medium C	Rich D	Very Rich E	
Actual Relative	SD 0	02					
	SD 1	ZONAL					
Soil Moisture Regime	F 2	01		03			
	F 3						
	F 4						
	M 5	04		05			
	VM 6	06		07			
	W 7		08		09		

- Subzone/variants have multiple site series indicating site conditions capable of producing different plant associations
- Site series are the most commonly used category for field use
- Edatopic grid presents the range of soil moisture and nutrient conditions associated with the site series

## Site Identification Procedure

### Biogeoclimatic Unit (Subzone/Variant)

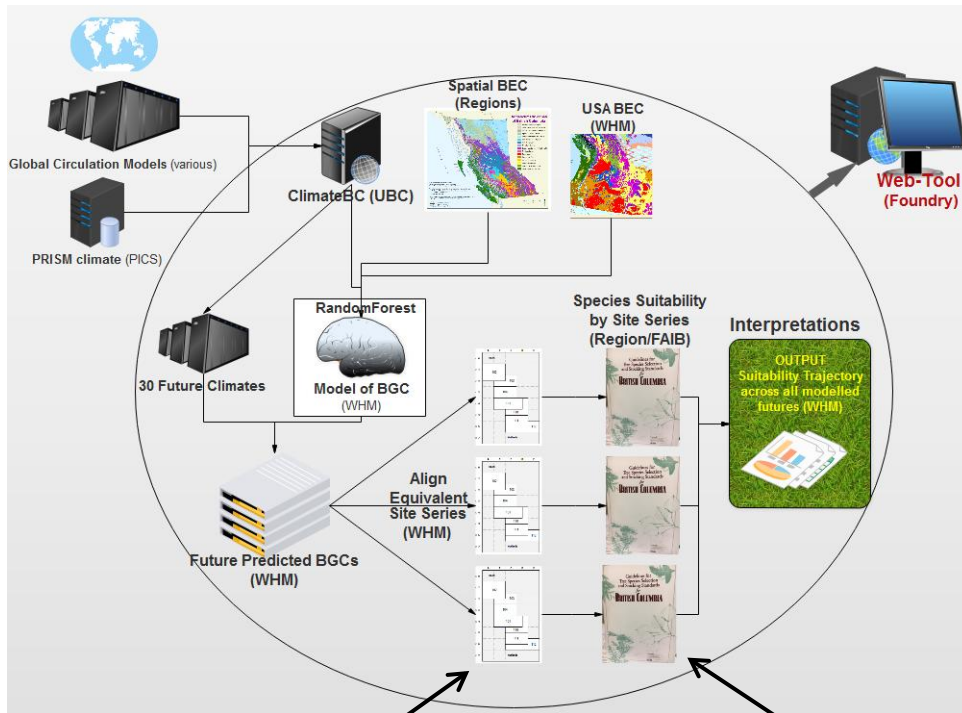

- |                  |  |
|------------------|--|
| PREFIELD         | <ul style="list-style-type: none"> <li>• Determine geographic location (including elevation)</li> <li>• Refer to maps of BGC unit distributions and cross-sections</li> <li>• Refer to other resource mapping (e.g., soils, terrain, TEM)</li> </ul> |
| EN ROUTE TO SITE | <ul style="list-style-type: none"> <li>• Observe terrain and zonal vegetation en route to the site</li> <li>• Refer to environment and vegetation summary tables for BGC units</li> </ul>  |

### Site Unit (Site series)

- |         |  |
|---------|--|
| AT SITE | <ul style="list-style-type: none"> <li>• Describe site, soil and vegetation conditions               <ul style="list-style-type: none"> <li>• Select sample area</li> <li>• Estimate % cover for vegetation in plot</li> <li>• Collect site information</li> <li>• Collect soil information from soil pit</li> <li>• Determine soil moisture and soil nutrient regime</li> </ul> </li> <li>• Identify site unit               <ul style="list-style-type: none"> <li>• Examine description of units</li> <li>• Integrate site, soil, and vegetation information</li> </ul> </li> </ul> |
|---------|--|

Coast Area BEC- Working on updates to: <ul style="list-style-type: none"> <li>• Classification</li> <li>• Mapping</li> </ul>	Also inputs to: <ul style="list-style-type: none"> <li>• Climate Change Informed Tree Species Selection (CCISS)/stocking standards</li> <li>• Climate-based Seed Transfer (CBST)</li> </ul>
---	---

# Climate Change Informed Tree Species Selection (CCISS) – components and research inputs

## BEC considerations:

- Predictability of bioclimate envelopes
- Changing site – vegetation relations
- Shifting species interactions and individual responses
- Increase in reliance on site factors, less on vegetation

## Site level/site types

- Sayward Forest (Carpenter & Dymond)
- Dry south coast climate change project (Coast Research, MFLNRO)

## Species

- Tree species (and ecosystems) (Gray; Rehfeldt; Iverson; Aitken)
- Dry coastal species (CDFmm and CWHxm) (Klassen)
- Seed source and deployment zones (O'Neill)
- Plant hardiness zones (CFS – McKenney)

- **BEC provides a foundation for prediction and detection of climate change at multiple scales**
- **BEC to inform silvicultural decisions at stand and landscape scales to reduce economic and ecological risk and increase these values**

## Stand Level Diversity:

- Reduces:
  - risk of complete stand failure
  - pest outbreak severity
- Enhances:
  - stand yield in a changing environment
  - structural attributes of habitat diversity
  - range of forest products

## Landscape Level Diversity:

- Reduces:
  - cumulative effects of individual stand-level decisions
  - risk of widespread losses from species-specific pests
  - spread and impact of other natural disturbances (e.g., fire)
- Enhances:
  - flexibility in stand management while meeting broader targets
  - feasibility of evaluating experimental options
